The research reported here was supported exclusively by the Center on Teaching and Learning (CTL), a research and outreach unit in the College of Education at the University of Oregon, its Director, Edward J. Kame'enui, Dean-Knight Professor, and Associate Director, Scott Baker. The data, analyses, results, and opinions expressed are those of the authors and CTL, and do not represent views of the College of Education or the University of Oregon.

## Technical Report 1102

## DIBELS Data System: 2009-2010 Percentile Ranks for DIBELS $6^{\text {th }}$ Edition Benchmark Assessments

In this report we present percentile ranks for DIBELS $6{ }^{\text {th }}$ Edition benchmark assessments, based on data entered into the DIBELS Data System (DDS) for the 2009-2010 school year. Percentile ranks (or percentiles) are a common metric used to facilitate the interpretation of individual characteristics relative to the distribution of those characteristics in a particular group of people. Percentiles can describe measurable physical characteristics, such as height or weight, as well as more abstract attributes, such as intelligence or reading proficiency. In either case, the validity of the interpretation depends on understanding what is being measured and the norm group being used for comparison.

## Recommended Standards for Interpreting Percentile Rank Scores

As an example, consider the issue of interpreting an individual's height-both as a raw score (number of centimeters tall) and a percentile score (percentile for height). If we know that someone is 164 centimeters tall we have some information about him or her, but we know very little else. Without knowing more about who the person is and to whom they are being compared, both raw scores and percentiles are difficult to interpret.

On one hand, if a person who is 164 centimeters in height is compared to adult males in the U.S., their score would be considered below the $5^{\text {th }}$ percentile and we could conclude that this person is short, relative to other U.S. adult males (Halls \& Hanson, 2000). In contrast, if we compare this person to 12 -year-old children in the U.S., their score would fall at about the $95^{\text {th }}$ percentile and we could conclude that this person is quite tall, compared to other 12 year-olds in
the U.S. (National Center for Health Statistics, 2000). If we used either of the above comparison groups and the person was actually an adult woman, we might have made an incorrect comparison and would draw the wrong conclusion. When the raw score value of 164 centimeters is compared to adult women in the U.S., the score falls at the 50th percentile for height, which is in the average range (Halls \& Hanson, 2000). The same raw score may correspond to very different percentile scores depending on the comparison group.

Educators use percentiles frequently to describe the relative position of student scores on performance-based measures. In all cases, the language used to describe the percentile score should convey the maximum possible information about the group to which the individual is being compared. Consider the following example as a guideline when interpreting student reading performance using the percentiles in this report. If $3^{\text {rd }}$-grade Jonny performed at the $75^{\text {th }}$ percentile on a commonly accepted measure of Oral Reading Fluency (e.g., DIBELS Oral Reading Fluency), it would be appropriate to say, "On a standard assessment of Oral Reading Fluency, Jonny performed as well as or better than 75 percent of other $3^{\text {rd }}$ grade students from DDS schools."

Percentile scores range from 0.1 to 99.9 , and these values can be described qualitatively. Table 1 provides low-inference descriptors for various percentile ranges and should be used in conjunction with a description of the comparison group. Therefore, a more complete description of Jonny's percentile above could read, "On a standard assessment of Oral Reading Fluency, Jonny performed as well as or better than 75 percent of other $3{ }^{\text {rd }}$ grade students from DDS schools. This performance places him in the above average range compared to students in this sample."

Table 1
Recommended Descriptors Associated with Percentile Ranges

| Percentile Range | Descriptor |
| :---: | :---: |
| $98^{\text {th }}$ percentile and above | Upper Extreme |
| $91^{\text {st }}$ to $97^{\text {th }}$ percentile | Well-Above Average |
| $75^{\text {th }}$ to $90^{\text {th }}$ percentile | Above Average |
| $25^{\text {th }}$ to $74^{\text {th }}$ percentile | Average |
| $9^{\text {th }}$ to $24^{\text {th }}$ percentile | Below Average |
| $3^{\text {rd }}$ to $8^{\text {th }}$ percentile | Well-Below Average |
| $2^{\text {nd }}$ percentile \& below | Lower Extreme |

## Context of the DIBELS Data System (DDS)

A second critical element needed for interpreting the percentiles provided in this report is an understanding of the DDS itself. The percentiles for DIBELS measures were calculated using data entered into the DDS for the 2009-2010 school year. The DDS is a web-based database used by schools and districts to "enter student performance results and create reports based on scores from DIBELS... The use of the DDS allows customers to derive the maximum benefit from the DIBELS measures" (https://dibels.uoregon.edu/samples/\#intro).

All data in this report were collected and entered by school and district personnel for the purpose of measuring and monitoring their students' reading skills. As a result, control of the data belongs entirely to the respective schools and districts, and we have limited knowledge about the accuracy of the data entered. We did not oversee data entry, data collection, or training of data collectors, and the students who are included in the sample were not systematically or randomly selected for the purpose of producing percentiles. That is, all students in the sample
attended schools that have taken some initiative to measure the reading skills of their students. Students from such schools may or may not be representative of "typical" students in all U.S. public schools.

Despite these limitations, we believe that data in the DDS were collected and entered in good faith, to the best of the abilities of the district and school personnel involved, and that these percentiles provide valuable information for users of the DDS. We have taken several steps to improve the quality of the data. Rather than including all data entered into the DDS, we instead employed modest exclusion criteria (described in the Participants subsection, pp. 11-16). In addition, we have compared participating schools to the U.S. population of public schools as an estimate of the overall representativeness of the sample (see Tables $6-19$, pp. 24-46).

The Method and Results sections are organized around three key areas. First, we describe the DIBELS measures, the participants who formed the basis for the sample in this technical report, and the exclusionary criteria that we applied to the sample (pp. 5-21). Next, we describe the final, total sample in detail; including the average number of students per district and students per school at each grade level and time of year (pp. 21-23); and the demographic information for the complete sample (pp. 24-46). In the final section of this report, we list percentile scores for each raw score across all DIBELS 6th Edition measures, by grade and time of year (pp. 48 93).

## Method

## Measures

DIBELS 6th Edition benchmark assessments are a collection of measures administered in various configurations from kindergarten through grade 6 . The DIBELS measures focus on essential reading skills in five critical areas of reading achievement: phonemic awareness,
phonics, accuracy and fluency, vocabulary, and comprehension (National Reading Panel, 2000). As students become proficient on skills, foundational measures are phased out and measures of more complex skills are introduced. For all measures (except Oral Reading Fluency Errors), higher scores indicate higher levels of the desired skill. Each measure is standardized and administered to individual students.

Figure 1 depicts the DIBELS 6th Edition benchmark assessment schedule (https://dibels.uoregon.edu/measures.php). Measures depicted with a dark bar are optional. In this report, we provide percentiles for all DIBELS 6th Edition measures, whether required or optional.

| Grade and Time of Year* |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0.1 | 0.2 | 0.3 | 1.1 | 1.2 | 1.3 | 2.1 | 2.2 | 2.3 | 3.1 | 3.2 | 3.3 | 4.1 | 4.2 | 4.3 | 5.1 | 5.2 | 5.3 | 6.1 | 6.2 | 6.3 |
| Initial <br> Sound <br> Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Letter Naming Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Word Use Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Phoneme Segmentation Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Nonsense Word Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | DIBELS Oral Reading Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
|  |  |  |  | Retell Fluency |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

*Value before the decimal indicates grade. Value after the decimal indicates time of year: $.1=$ fall, $.2=$ winter, $.3=$ spring.
Figure 1. Schedule of DIBELS benchmark assessment administration.
Initial Sound Fluency (ISF). ISF is a measure of phonemic awareness skills that assesses a child's ability to recognize and produce the initial sound or group of sounds in a word that is read aloud to them (Good \& Kaminski, 2002). The examiner presents four pictures to the child, names each picture, and then asks the child to identify (i.e., point to or say) the picture that
begins with the sound pronounced by the examiner. For example, the examiner says, "This is sink, cat, gloves, and hat. Which picture begins with /s/?" The child is to say the name of the picture and/or point to one of the given pictures that match the initial sound. The examiner calculates the amount of time taken to identify/produce the correct sound and converts the score into the number of correct initial sounds per minute. Standard administration and scoring procedures call for the administration of all 16 ISF items for each test administration.

Letter Naming Fluency (LNF). The LNF task (Good \& Kaminski, 2002; Marston \& Magnusson, 1988) provides a measure of risk related to future literacy development. Students are presented with a page of upper- and lower-case letters arranged in a random order and are asked to name as many letters as they can. Students are told that if they do not know a letter, they will be told the letter. The student is allowed one minute to produce as many letter names as $\mathrm{s} / \mathrm{he}$ can, and the total DIBELS LNF score is equal to the number of letters named correctly in one minute. If a student finishes all of the LNF items on the page before one minute has elapsed, the recommendation is to stop, and record their final score into the DDS, without prorating. Prior to 2007, the administration and scoring guidelines suggested that students were to start over at the top of the probe if they finished all of the items on the probe before one minute had elapsed. The examiner would then record the total number of items completed correctly for both the first and second time through the probe. Although the current recommendation is to record the child's final score at the end of the probe, with no prorating, it is possible that some testers administered the assessment according to the previous recommendation even in the 2009-2010 school year. LNF is administered throughout kindergarten, and in the fall of grade 1.

Phoneme Segmentation Fluency (PSF). PSF is a test of phonemic awareness (Good \& Kaminski, 2002) that assesses a student's ability to fluently segment three- and four-phoneme
words into their individual phonemes. PSF is a good predictor of later reading achievement (Kaminski \& Good, 1996). The examiner administers the PSF task by reading aloud words of three to four phonemes. Students are required to say the individual phonemes in each word. For example, if the examiner says, "sat", the student would say, "/s/ /a/ /t/" to receive a total of three points for the word. After the student responds, the examiner presents the next word, and the total score is the number of correct phonemes produced in one minute. If a student finishes all of the PSF items on the page before one minute has elapsed, the recommendation is to stop, and record their final score into the DDS, without prorating. Prior to 2007, the administration and scoring guidelines suggested that students were to start over at the top of the probe if they finished all of the items on the probe before one minute had elapsed. The examiner would then record the total number of items completed correctly for both the first and second time through the probe. Although the current recommendation is to record the child's final score at the end of the probe, with no prorating, it is possible that some testers administered the assessment according to the previous recommendation even in the 2009-2010 school year. This measure is administered in the winter and spring of kindergarten, and in the fall, winter, and spring of grade 1.

Nonsense Word Fluency (NWF). The NWF task measures knowledge of the alphabetic principle-including both letter-sound correspondence and the ability to blend letters into words in which letters represent their most common sounds (Good \& Kaminski, 2002; Kaminski \& Good, 1996). Students are presented with a page of randomly ordered VC and CVC nonsense words (e.g., sig, rav, ov) and asked to either: (a) say the individual letter sound of each letter, or (b) read the whole nonsense word. For example, if the stimulus word is "sim" the student could say $/ \mathrm{s} / / \mathrm{i} / / \mathrm{m} /$ to obtain a total of three letter sounds correct, or say the word $/ \mathrm{sim} /$ to obtain a total
of three correct letter sounds (CLS) and one word recoded correctly (WRC). The WRC score does not take into account whether or not a student sounded out a word before reading it correctly as a whole word (see Harn, Stoolmiller, \& Chard, 2008 as well as Cummings, Dewey, Latimer, \& Good, 2011 for a description of alternative WRC coding metrics). So, for example, a student would receive credit for NWF-WRC if $\mathrm{s} / \mathrm{he}$ read the nonsense word "sim" as $/ \mathrm{s} / / \mathrm{i} / / \mathrm{m} /$, /sim/ in DIBELS 6th Edition NWF.

The student is allowed one minute to say as many letter-sounds as $\mathrm{s} / \mathrm{he}$ can, and the final score consists of both the number of letter-sounds produced correctly in one minute and the number of words read correctly-whether sounded out and then recoded or read as whole words. If a student finishes all of the NWF items on the page before one minute has elapsed, the recommendation is to stop, and record their final score into the DDS, without prorating. Prior to 2007, the administration and scoring guidelines suggested that students were to start over at the top of the probe if they finished all of the items on the probe before one minute had elapsed. The examiner would then record the total number of items completed correctly for both the first and second time through the probe. Although the current recommendation is to record the child's final score at the end of the probe, with no prorating, it is possible that some testers administered the assessment according to the previous recommendation even in the 2009-2010 school year. NWF is given in the winter and spring of kindergarten, throughout grade 1 , and in the fall of grade 2.

Oral Reading Fluency (ORF). ORF is a measure of accuracy and fluency with reading connected text (Children's Educational Services, 1987; Good, Kaminski, \& Dill, 2002). DIBELS ORF 6th Edition passages were authored with the guideline that they correspond to "...approximately equivalent difficulty levels within a grade" (Good, Kaminski, Smith, \&

Bratten, 2001). Based on an analysis of grade 2 ORF passages (Good \& Kaminski, 2002), the Spache readability formula was selected as the target readability statistic for all grades. Good and colleagues (2001) report that for DIBELS 6th Edition, grade 1 passages, target Spache readabilities ranged from 2.0 to 2.3; for grade 3 target Spache readabilities ranged from 2.8 to 3.1. No data are available on the specific targeted readability levels for grades 4-6.

To obtain the benchmark score for ORF, students are asked to read three passages aloud, for one minute each. Words omitted, substitutions, and hesitations of more than three seconds are scored as errors. Words self-corrected within three seconds are scored as correct. The oral reading fluency rate is the median number of words (from the three passages) that are read correctly in one minute. The median number of errors made while reading is also recorded, so that overall reading accuracy can be computed. Like all other DIBELS measures, if a student finishes the ORF passage before one minute has elapsed, the recommendation is to stop, and record their final score into the DDS, without prorating. Prior to 2007, the administration and scoring guidelines suggested that students were to start over at the top of the probe if they finished the probe before one minute had elapsed. The examiner would then record the total number of words read correctly for both the first and second time through the probe. Although the current recommendation is to record the child's final score at the end of the probe, with no prorating, it is possible that some testers administered the assessment according to the previous recommendation even in the 2009-2010 school year. ORF is administered in the winter and spring of grade 1 , and in the fall, winter, and spring of grades 2 through 6.

Retell Fluency (RTF). RTF provides a comprehension check for the ORF assessment (Good \& Kaminski, 2002; Dynamic Measurement Group, 2008). It takes approximately one minute to administer, and is given after each of the three ORF passages read at benchmark-
provided that a discontinue rule has not been met (i.e., students must read at least 10 words correctly on the ORF passage in order to be administered RTF). After each passage is read, the examiner asks the child to, "tell me everything you can about what you just read." During the retell, if the student pauses for three seconds, the examiner prompts the student to continue. After giving the first prompt, the examiner discontinues the retell if (a) the student is silent for five seconds, or (b) the student gets off track for five seconds, or (c) after one minute has elapsed. The score is the median number of words in the child's retell (from the three ORF passages) that are related to the passage. RTF is considered optional, but may be administered any time that ORF is administered.

Word Use Fluency (WUF). The WUF measure is an indicator of vocabulary and oral language, assessing a student's expressive vocabulary skills. Students are asked to use a word in a sentence. After the task is modeled, the examiner reads words one at a time, and prompts the student's response. The task is timed and examiners continue to present words until the end of one minute. As the student responds, the examiner marks the number of words the student says. The student's score is the number of words used correctly in response to the stimulus words. If a student does not use any of the first 5 words correctly, the task is discontinued and a score of zero is recorded. If a student finishes all of the stimulus words before the end of a minute, examiners are instructed to stop the assessment and record the score. Prior to 2007, the administration and scoring guidelines suggested that students were to start over at the top of the probe if they finished all of the items on the probe before one minute had elapsed. The examiner would then record the total number of items completed correctly for both the first and second time through the probe. Although the current recommendation is to record the child's final score at the end of the probe, with no prorating, it is possible that some testers administered the
assessment according to the previous recommendation even in the 2009-2010 school year. WUF is optional and may be administered to children from fall of kindergarten through the spring of grade 3.

## Participants

The percentiles for DIBELS 6th Edition are based on scores from all students who attended a school that used the DDS during the 2009-2010 school year, unless they met specific exclusion criteria (see pp. $24-46$ of this report for a complete description of the demographic characteristics of this sample). We utilized two school-level and two student-level exclusion criteria.

Selection criteria - school level. Students were included in the percentiles sample if: (a) we could identify the National Center for Education Statistics (NCES, 2011) identification number for their school; and (b) we had access to the most recent (2009-2010) NCES data for their school. These two criteria are essential, so that we can describe characteristics of participating schools using NCES data and compare them to schools not included in the sample. Because NCES data for private schools had not been released at the time this report was written (October, 2011), the percentiles in this report include only students who attended U.S. public schools.

The second criteria was introduced to exclude schools that don't test most of their students and to allow us to characterize important demographic information about the students on which these percentiles are based. Districts are encouraged to assess and enter data for all children, at each grade level, during three benchmark assessment periods (i.e., beginning, middle, and end) each school year. We can assess the validity of this assumption by dividing the total number of students with DIBELS data in each grade by the number of students enrolled in
each grade as reported to NCES (2011). If a school assessed all of their students and reported their enrollment to NCES accurately, we would expect this percentage to equal 100. If the percentage were close to 100 , it would indicate that the school assessed most of their students, likely including all ranges of skill level. If the percentage were low, schools may be selecting only certain subgroups of students to test. If the percentage were much greater than 100 , schools may be testing students out of grade level.

We defined the number of students assessed with DIBELS as the total number of students with entered fall data for LNF in kindergarten, NWF-CLS in grade 1, and ORF in grades 2 through 6. We elected to use the number of fall data points because NCES enrollment numbers are also collected as of October $1^{\text {st }}$ of each school year. We eliminated schools, by grade, from our analyses if the number of DDS data points was less than or equal to $80 \%$, or greater than or equal to $120 \%$, of the number of students reported to NCES.

Table 2 shows the effect of the two school-level selection criteria for each grade. The original pool of schools ranges from 2,541 for grade 6 to 11,901 for grade 1 . The final sample, with the exclusion criteria applied, ranges from 1,894 to 10,160 schools for grades 6 and 1 , respectively. The total reduction in sample size after the exclusionary criteria are applied ranges from $14.6 \%$ for grade 1 to $25.5 \%$ for grade 6 .

Table 2
Effect of Selection Criteria on Number of Schools Included in Percentiles Calculations

| Grade |  | Percent of schools excluded due to: |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Number of DDS schools with fall data | Unable to match to NCES ID | Out of range DDS percentage relative to NCES enrollment | Final Number of Schools Included |
| 0 | 11,671 | 8.2 | 7.9 | 9,798 |
| 1 | 11,901 | 8.3 | 6.3 | 10,160 |
| 2 | 11,389 | 8.1 | 6.8 | 9,688 |
| 3 | 9,489 | 8.0 | 8.2 | 7,952 |
| 4 | 6,808 | 6.8 | 14.1 | 5,387 |
| 5 | 5,772 | 6.0 | 15.4 | 4,538 |
| 6 | 2,541 | 7.9 | 17.6 | 1,894 |

Figure 2 shows a box-percentile plot of the percent of DDS data points relative to NCES enrollment for each grade in the final sample. The box-percentile plot is a modified box plot that uses width to convey information about the distribution of data. For any given value on the $y$ axis (i.e., in Figure 2, the DDS percentage relative to NCES enrollment) the width is proportional to the percentile of that value, up to the $50^{\text {th }}$ percentile. Above the $50^{\text {th }}$ percentile the width is proportional to 100 minus the percentile. Therefore, the width for any given $y$ value is proportional to the percent of data points more extreme in that direction (Esty \& Banfield, 2003). The median is indicated by the bold (red) horizontal line going across the entire graph. The light gray (green) lines directly below and above the median line represent the $25^{\text {th }}$ and $75^{\text {th }}$ percentiles. The dark gray (blue) lines closest to the bottom and top of the graph represent the $10^{\text {th }}$ and $90^{\text {th }}$ percentiles.

Figure 2. Box-percentile plots of the percentage of DDS data points relative to NCES enrollment in each grade.

There are some important features to notice in Figure 2. First, the median for all grades is $100 \%$, which is the value we would expect if schools test all of their students. Second, $80 \%$ of the values are between 93 and 103 (the $10^{\text {th }}$ and $90^{\text {th }}$ percentiles, respectively), indicating that most schools are testing almost all or a few more students than the number enrolled. Third, the bottom half of the graphs are generally wider than the top half of the graphs, indicating that schools are more likely to test fewer students than enrolled, rather than more students than enrolled. Fourth, the graphs for each grade are very wide and tend to overlap with the adjacent grades indicating that a great majority of the schools test $100 \%$ of their students. Finally, in grade 6 the $75^{\text {th }}$ percentile (i.e., light gray or green line) does not appear because the $75^{\text {th }}$ and $50^{\text {th }}$ percentile are equivalent. Figure 3 shows an example of the box-percentile plot for a single grade (i.e., grade 1) to illustrate the detail of the plot.

Figure 3. Box-percentile plot for grade 1.
Overall, the plots are consistent with our expectations: most schools test $100 \%$, or close to $100 \%$, of their students. We also expected to see some schools that test only a portion of their students. Somewhat surprising is the number of schools that test more students than reported to NCES. One possible explanation for this occurrence is small enrollment overall. For example, a school could report an enrollment on October $1^{\text {st }}$ of four students. Subsequently a fifth student could enroll in the school after October $1^{\text {st }}$ and, if tested, this would result in a percentage of 120. Future investigation will explore additional reasons why some schools appear to test far fewer or far more students than reported to NCES.

Selection criteria - student level. In addition to the above school-level criteria, we also excluded individual scores if they exceeded the maximum possible number of items on the probe (i.e., we assumed that DIBELS scores were not prorated nor were any of the measures repeated). This criterion was included due to inconsistencies in the way schools administer and score
assessments, and to eliminate extreme data points that are possible due to random data entry errors. We also screened out scores that were not possible given students' pattern of performance on other measures (i.e., bivariate illegal values).

Nonsense Word Fluency (NWF). Scores on the NWF measure were excluded from analysis if either the Correct Letter Sounds (CLS) score was missing, or if the WRC score was greater than half of the CLS score. For example, a WRC score of 8 would not be allowed if the same student had a recorded CLS score that was less than or equal to 15 .

Oral Reading Fluency (ORF). Values for the ORF Errors and Retell Fluency scores were excluded if the corresponding ORF score was missing. ORF Accuracy scores were not calculated if either the ORF or the ORF Errors scores were missing.

We display the number of available data points for each measure by grade, and the impact of our exclusion criteria on the number of students included in the percentiles in Table 3. The exclusion criteria resulted in an average reduction in the size of the sample that ranged from $5.45 \%$ in grade 3 to $11.67 \%$ in grade 6 . We feel that these exclusion criteria are modest, relative to the size of the total DDS sample, and the nature of the DDS as an extant database with little external control of the validity of data entry procedures. We believe these criteria allow us to achieve a balance between screening out data that likely are not valid and should not be included, and including all relevant scores.

Table 3
Effect of Selection Criteria on Sample Size.

| Benchmark time | Measure | Sample from ALL DDS schools | Percent excluded due to: |  |  |  | Final sample size |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | School not matched to NCES ID | Out of range participation | Scores above max value | Bivariate illegal values |  |
| Kindergarten |  |  |  |  |  |  |  |
| Fall | ISF | 717,619 | 3.53 | 5.73 | 0.00 | 0.00 | 651,158 |
|  | LNF | 727,130 | 3.52 | 5.49 | 0.00 | 0.00 | 661,629 |
|  | WUF | 206,389 | 2.44 | 4.66 | 0.01 | 0.00 | 191,714 |
| Winter | ISF | 703,452 | 3.46 | 7.19 | 0.00 | 0.00 | 628,499 |
|  | LNF | 717,326 | 3.44 | 7.16 | 0.00 | 0.00 | 641,248 |

Final total sample sizes. Table 4 displays the total number of districts, and the distribution of the number of students per district, for each grade and time point in our sample. In the first column of the table, we use the value after the decimal point to indicate the time of year: " .1 " indicates the beginning of the year, " .2 " the middle of the year, and ". 3 " the end of the year.

Because several relatively large districts are included in the DDS sample, the distribution of the total number of students per district is positively skewed, with the mean noticeably higher than the median. As a result, the median is more representative of the size of the typical participating district in the sample. This value ranges from a low of 44 students per district at the end of grade 6 to the high score of 83 students per district at both the beginning and middle of kindergarten.

Table 4.
Number of Districts and Participating Students per District Included in System-Wide Percentiles

| Grade Benchmark time | $N$ Districts | Number of Participating Students per District |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note. Q25 = lower quartile; Q50 = median; Q75 = upper quartile.

Table 5 displays the number of schools, and the distribution of the number of students per school, included in the sample for each grade and time point. These distributions show relatively little skew and the mean in most cases is roughly equivalent to the median. The mean number of students participating per school is about 63, ranging from a low of 55.48 in the middle of grade 6 to a high of 67.54 in the beginning of grade 1.

Table 5

Note. Q25 = lower quartile; Q50 = median; Q75 = upper quartile.

## Participant demographic information

We can also describe various characteristics of schools in our sample using NCES data from the school year 2009-2010 (NCES, 2011). The comparability of DDS and all other nonDDS schools in the U.S. is presented in the two right-most columns in Tables 6 through 12, by grade. The composition of all U.S. public schools is listed as well, in the first column, for an additional point of reference. Some differences are noticeable. Overall, DDS schools are distributed differently throughout the country, with significantly more DDS schools found in the West and fewer DDS schools found in the South, relative to other, non-participating U.S. schools [for example in kindergarten $X^{2}(3, n=49,495)=290.68, p<.0001$ ]. Starting in grade 4 , there are also more DDS schools in the Midwest, compared to non-DDS schools. Other differences in geographic location exist, and vary by grade. Additional school characteristics, such as location relative to population centers and school type, are also presented in the tables that follow.

Overall, it appears that DDS schools are more likely to be located in small towns and rural areas. In kindergarten through grade $5, \mathrm{DDS}$ schools are very similar to all other non-DDS schools in the U.S. based on their Schoolwide Title I eligibility ( $M d n=56 \%$ eligible for DDS schools; 55\% eligible for non-DDS schools). In grade 6, DDS schools have larger Schoolwide Title I percentages than other non-DDS schools in the country (55\% eligible for DDS schools; $50 \%$ eligible for non-DDS schools).

DDS schools display some marked differences from non-DDS schools in terms of race and ethnicity. One particularly noticeable difference is that, on average, DDS schools report a higher percentage of White students ${ }^{1}$ ( $62.1 \%$ White) compared with other, non-DDS U.S. schools ( $52.6 \%$ White). This difference results in a small effect size (0.27) using Cohen's (1992)

[^0]standards. Data regarding other similarities and differences between DDS, and U.S. public schools in terms of gender, race/ethnicity, and student-to-teacher ratio are reported for each grade in Tables 13 through 19.

Other meaningful differences in demographic composition in our DDS sample relative to non-DDS U.S. schools include fewer overall numbers of students who are Hispanic (13.5\% versus $21.9 \%$; kindergarten $e s=0.32$ ), and more students whose race/ethnicity is unknown or not reported ( $3.8 \%$ versus $1.7 \%$; kindergarten $e s=0.23$ ). These differences result in small to medium effect size estimates, and should factor in to a school's decision-making practices when determining the appropriateness of the current comparison group for their students.

DDS schools represent the average U.S. public school well in terms of overall rate for free/reduced price lunch $(M d n=53.3 \%$ of qualifying students in DDS schools; $M d n=52.3 \%$ in non-DDS schools), and school-wide eligibility for Title I ( $M d n=56.1 \%$ of DDS schools; $M d n=$ $54.6 \%$ of non-DDS schools) As noted in Table 12, the schools that serve grade 6 students in our sample are more likely to be Title I eligible than the average U.S. school (55\% compared with $50 \%$ ). In terms of class sizes (expressed as pupil-to-teacher ratio in Tables $13-19$ ), DDS schools show no meaningful differences from all other non-DDS U.S. schools. The median pupil-to-teacher ratio in DDS schools is 17.0; the median for non-DDS schools is 16.2.

In addition to the demographic characteristics listed above, we also know that schools in our sample have varying levels of familiarity and experience with DIBELS (years of use range $=$ 1 year to 11 years). The average number of years of DDS use is 4.87 . Eighty-three percent of schools in the sample have been using the DDS for three or more years.

Note. All data reflect grade level data reported to NCES, except Free / Reduced Lunch and Pupil to Teacher Ratio, which are reported to NCES at the school level. Although Free / Reduced Lunch and Pupil to Teacher Ratio are school level, the descriptives are slightly different for each grade because the sample for each grade was selected independently. All reported values (except Pupil to Teacher ratio) are expressed as proportions. Pupil to teacher ratio was trimmed (values exceeding the 99th percentile of all schools were recoded back to the 99 th percentile value) to avoid distortion due to extreme outliers. Data source: NCES (2011).

Note. All data reflect grade level data reported to NCES, except Free / Reduced Lunch and Pupil to Teacher Ratio, which are reported to NCES at the school level. Although Free / Reduced Lunch and Pupil to Teacher Ratio are school level, the descriptives are slightly different for each grade because the sample for each grade was selected independently. All reported values (except Pupil to Teacher ratio) are expressed as proportions. Pupil to teacher ratio was trimmed (values exceeding the 99th percentile of all schools were recoded back to the 99 th percentile value) to avoid distortion due to extreme outliers. Data source: NCES (2011).

Note. All data reflect grade level data reported to NCES, except Free / Reduced Lunch and Pupil to Teacher Ratio, which are reported to NCES at the school level. Although Free / Reduced Lunch and Pupil to Teacher Ratio are school level, the descriptives are slightly different for each grade because the sample for each grade was selected independently. All reported values (except Pupil to Teacher ratio) are expressed as proportions. Pupil to teacher ratio was trimmed (values exceeding the 99th percentile of all schools were recoded back to the 99 th percentile value) to avoid distortion due to extreme outliers. Data source: NCES (2011).

Note. All data reflect grade level data reported to NCES, except Free / Reduced Lunch and Pupil to Teacher Ratio, which are reported to NCES at the school level. Although Free / Reduced Lunch and Pupil to Teacher Ratio are school level, the descriptives are slightly different for each grade because the sample for each grade was selected independently. All reported values (except Pupil to Teacher ratio) are expressed as proportions. Pupil to teacher ratio was trimmed (values exceeding the 99th percentile of all schools were recoded back to the 99th percentile value) to avoid distortion due to extreme outliers. Data source: NCES (2011).

## Additional Considerations

It is important to be aware that although the participating schools and districts in this report are distributed widely across the country (see Tables 5-11), they may not be fully representative of the instruction and assessment practices that are used throughout the U.S. As noted in the previous DIBELS 6th Edition percentiles technical report (Good, Wallin, Simmons, Kame'enui, \& Kaminski, 2002), DDS schools may be more likely than average U.S. schools to engage in practices that support early literacy development. Schools and districts in our sample may be more likely than a typical school to be invested in the beginning reading core areas of phonemic awareness, phonics, and fluency with connected text (National Reading Panel, 2000). They also may be more likely to engage in universal screening and progress monitoring with their students.

If your school is currently using the DDS, then we argue that this comparison group still provides important contextual information regarding your school's performance. However, we must point out that our sample has not been randomly selected, it is not a probability sample, and the data were collected with few constraints.

## Example of Recommended Standards for Describing Student Performance Using the

## Percentiles in this Report

Recall that the language used to describe percentile scores should convey as much information as possible, including a description of what is being measured and the group to which the individual is being compared. Incorporating a description of the task and comparison group, a complete, low-inference interpretation of an individual student's performance on a given DIBELS 6th Edition measure is as follows:

In (time of year), (name of student) performed as well as or better than $X X \%$ of (grade) students included in the 2009-2010 DDS percentile sample for (name of measure), a task that requires students to (description of task). The percentile sample included students in public schools that use the DDS and test most of their students in (grade). This means that (name of student) performed in the (descriptor from Table 1) range relative to other students in this group.

For example:
In the fall, Sarah performed as well as or better than $63 \%$ of kindergarten students included in the DDS 2009-2010 percentile sample for DIBELS Letter Naming Fluency, a task that requires students to name randomly ordered printed letters for one minute. This comparison sample included students in public schools that use the DDS and test most of their students in kindergarten. This means that Sarah performed in the average range relative to other students in this group.

## Results

Results are reported in sections according to grade level. Each section includes two tables. The first table provides DIBELS 6th Edition descriptive statistics, including: (a) the mean, standard deviation, $25^{\text {th }}, 50^{\text {th }}$, and $75^{\text {th }}$ percentiles; (b) the number of districts, schools, and students included in the analyses at each time point; and (c) the percent of students at each time point who performed in the "at-risk/deficit," "some-risk/emerging," and "benchmark/established" ranges for measures that have defined cut scores for these categories. These ranges are defined for kindergarten through grade 3 in a technical report by Good, Simmons, Kame'enui, Kaminski and Wallin (2002), and are available for all grades at
https://dibels.uoregon.edu/benchmark.php. The second table in each section reports the percentiles for each measure.

We computed the percentiles for each score on each measure by adding the percent of students who scored below that score to one half of the percent of students at that score (Salvia \&Ysseldyke, 2004). For example, the percentile for a score of 10 on LNF in the fall of kindergarten was obtained by adding the percent of students who scored below 10 (39.79\%) to half of the percent of students that scored at exactly $10(.5 * 2.00 \%)$, resulting in a percentile of 40.79. Reported percentiles were rounded to the nearest whole number using standard conventions. This methodology is consistent with that used in the previous report of system-wide percentiles for DIBELS measures (Good et al., 2002).

Percentiles are reported at each time point a measure is offered, including: ISF at the beginning and middle of kindergarten; LNF from the beginning of kindergarten through the beginning of grade 1 ; PSF from the middle of kindergarten through the end of grade 1 ; NWF (both CLS and WRC) from the middle of kindergarten through the beginning of grade 2; ORF, ORF Errors, ORF Accuracy and RTF from the middle of grade 1 through grade 6; and WUF from the beginning of kindergarten through grade 3 .

When examining the percentiles for the ORF Errors scores, note that the valences (i.e., values) for these scores are reversed. Because fewer errors are more desirable, higher percentiles always indicate better performance. That is, few errors result in a higher percentile and many errors result in a lower percentile.
